Syntax

• Identifying users and their groups • whoami groups • See **file** 's metadata: **stat file** • Changing permissions: • Symbolic notation: chmod [ugoa][+ -][rwx] files . • Adding execution permission to the owner on file : chmod u+x file . • Removing writing permission to the primary group on file : chmod g-w • Setting read and execution permissions to others on file : chmod o=rx file • Changing several permissions simultaneously on file : chmod u+w,g-x,o-r file . • Octal notation: chmod ddd where d represents a digit between 0 and 7. • - : o (no permissions) - x : 1 (execute only permission) • -w : 2 (write only permissions) • -wx : 3 (write and execute permissions) • r- : 4 (read only permissions) • **r-x**: **5** (read and execute permissions) • rw- : 6 (read and write permissions) • **rwx**: 7 (read, write, and execute permissions)

- Changing ownership on file : chown [new_owner][:new_group] file
 - Changing both the ownership and the group of file1 : sudo chown
 new_owner:new_group file .
 - Changing the ownership of file while maintaining its group: sudo chown new_owner file .
 - Changing the group of file while maintaining its ownership: sudo chown :new_group file .
- Running command with superuser privileges: sudo command

Concepts

• Operating systems implement the concept of users.

- In Unix-like systems, everything is a file.
- Files have owners and group owners.
- Permissions are limits to the actions that users can perform.
- Permissions are a property of both files and users.
- To facilitate managing permissions, there is also the concept of group (of users). Groups also have permissions.
- Some users (like the superuser) have permissions to do everything.
- Users can elevate their priveleges to that of the superuser. Extra care is needed when using this power.
- In *nix systems, users can elevate their privileges with sudo .

Resources

- The origin of "Everything is a file".
- The setuid and setgid permission bits.
- Difference between symbolic link and shortcut
- Identifying file types in Linux
- POSIX standards on chmod
- The Uppercase X in chmod
- Effective user and real user
- Changing default permissions on file creation
